

Introduction and History

- · Blood typing provides class evidence
- DNA profiling provides individual evidence
- A blood splatter pattern provides information
 - the truthfulness of an account by a witness or a suspect
 - the origin of the blood
 - the angle and velocity of impact
 - the type of weapon used

Blood Facts

The average adult has about **FIVE** liters of blood inside of their body, which makes up 7-8% of their body weight.

Blood is living **tissue** that carries oxygen and nutrients to all parts of the body, and carries carbon dioxide and other waste products back to the lungs, kidneys and liver for disposal. It also fights against **infection** and helps heal **wounds**, so we can stay healthy.

There are about one **billion** red blood cells in two to three drops of blood. For every **600** red blood cells, there are about **40** platelets and **one** white cell.

What makes up our blood?

- RED BLOOD CELLS (Erythrocytes) The most abundant cells in our blood; they are produced in the bone marrow and contain a protein called hemoglobin that carries oxygen to our cells
- WHITE BLOOD CELLS (Leukocytes) They are part of the immune system and destroy infectious agents called pathogens.
- PLASMA This is the yellowish liquid portion of blood that contains electrolytes, nutrients and vitamins, hormones, clotting factors, and proteins such as antibodies to fight infection.
- PLATELETS (Thrombocytes) The clotting factors that are carried in the plasma; they clot together in a process called coagulation to seal a wound and prevent a loss of blood.

What are blood types?

There are 3 alleles or genes for blood type: A, B, & O. Since we have 2 genes, there are 6 possible combinations.

Blood Types

AA or AO = Type A

BB or BO = Type B

OO = Type O

AB = Type AB

| The ABO Blood System | | | | | | |
|--|----------------------|----------------------|-----------------------|--------------------|--|--|
| Blood Type (genotype) | Type A (AA, AO) | Type B (BB, BO) | Type AB (AB) | Type 0 (00) | | |
| Red Blood Cell Surface Proteins (phenotype) | A A A | BBB | A BAB | | | |
| (pnenotype) | A agglutinogens only | B agglutinogens only | A and B agglutinogens | No agglutinogens | | |
| Plasma Antibodies (phenotype) | 1/6/6 | * | NONE. | 100 | | |
| | b agglutinin only | a agglutinin only | No agglutinin | a and b agglutinin | | |

Blood Typing- Proteins

- · Discovered in 1900 by Karl Landsteiner
- Identifies the presence or absence of particular proteins embedded in the cell
- Quicker and less expensive than DNA profiling
- Produces class evidence but can still link a suspect to a crime scene or exclude a suspect

Rh Factor

85% of the population has a protein called Rh factor on their blood cells

Protein A present Rh protein absent Type A-

Rh Factors

- Scientists sometimes study Rhesus monkeys
 to learn more about the human anatomy
 because there are certain similarities between
 the two species. While studying Rhesus
 monkeys, a certain blood protein was
 discovered. This protein is also present in the
 blood of some people. Other people, however,
 do not have the protein.
- The presence of the protein, or lack of it, is referred to as the Rh (for **Rhesus**) factor.
- If your blood does contain the protein, your blood is said to be Rh positive (Rh+). If your blood does not contain the protein, your blood is said to be Rh negative (Rh-).

A+ A-B+ B-AB+ AB-O+ O-

Blood typing- Antibodies

- Antibodies are Y-shaped proteins secreted by white blood cells that attach to antigens to destroy them

SciShow "What are blood types?"

Blood Enzymes

- Enzymes are complex proteins that catalyze different biochemical reactions
- Many enzymes and proteins have been found in the blood that are important for identification purposes

How common is your blood type?

| TYPE | DISTRIBUTION | RATIOS | |
|------|-----------------|--------|--------|
| O + | 1 person in 3 | 38.4% | 46.1% |
| O - | 1 person in 15 | 7.7% | |
| A + | 1 person in 3 | 32.3% | 20.00/ |
| A - | 1 person in 16 | 6.5% | 38.8% |
| B + | 1 person in 12 | 9.4% | 11 10/ |
| В- | 1 person in 67 | 1.7% | 11.1% |
| AB+ | 1 person in 29 | 3.2% | 7 |
| AB - | 1 person in 167 | 0.7% | 3.9% |

Blood Transfusions

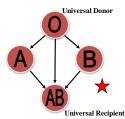

A **blood transfusion** is a procedure in which blood is given to a patient through an intravenous (IV) line in one of the blood vessels. Blood transfusions are done to replace blood lost during surgery or a serious injury. A transfusion also may be done if a person's body can't make blood properly because of an illness.

Who can give you blood?

People with **TYPE O** blood are called **Universal Donors**, because they can give blood to any blood type.

People with **TYPE AB** blood are called **Universal Recipients**, because they can receive any blood type.

 $Rh + \rightarrow Can \ receive + or - Rh - \rightarrow Can \ only \ receive -$

Blood Evidence

- <u>Blood samples</u> Can be analyzed to determine **blood type** and **DNA**, which can be matched to possible suspects.
- <u>Blood droplets</u> Can be analyzed to give clues to the location of a **crime**, movement of a **victim**, and type of **weapon**.
- <u>Blood spatter</u> Can be analyzed to determine **patterns** that give investigators clues to how a crime might have happened.
