

AP Worksheet 3b (Gas Laws)

For numbers 1 through 3 the temperature and the amount of gas are both constant.

1. Write a mathematical equation expressing the relationship between pressure and volume.
 $P_1V_1 = P_2V_2$
2. Calculate the new pressure if a 2.45 L sample of a gas at a pressure of 1.01 atm is contracted to a volume of 2.29 L. **1.08 atm**
3. Calculate the new volume if 13.3 L of a gas initially at a pressure of 2.51 atm is subjected to an *increase* in pressure equivalent to 65.0 mmHg. **12.9 L**

For numbers 4 through 6 the pressure and the amount of gas are both constant.

4. Write a mathematical equation expressing the relationship. $\frac{V_1}{T_1} = \frac{V_2}{T_2}$
5. Calculate the volume of a particular gas if 1.23 L of it, initially at a temperature of 32.0 °C is subjected to a *drop in* temperature of 19.0 °C. **1.15 L**
6. Calculate the volume of a gas if a 12.78 L sample of it, initially at a temperature of -50.00 °C is heated to a temperature of 28.00 °C. **17.2 L**

For numbers 7 and 8, assume the gas behaves ideally.

7. A sample of a group 1 bromide weighing 2.000 g was converted to a gas at 504.0 °C and 1.000 atm of pressure. The resulting vapor occupies a volume of 1238 mL. Identify the group 1 metal present in the compound. **Na (closest to molar mass)**
8. What volume does 1.24 g of fluorine gas occupy under conditions of 5.20 °C and 2.04 atm? **0.365 L**

For numbers 9 and 10, Standard Temperature and Pressure (STP) is 0 °C and 1.00 atm.

9. *The density of oxygen is 1.43 g/L at STP. Determine the density at 17 °C and 800. torr.*
1.41 g/L
10. Determine the volume occupied by 4.0 g of chlorine gas at STP. **1.26 L**

* = challenge
