

Periodic Properties of the Elements

Chapter 7

1

Periodic Classifications

- **Remember:**
 - Vertical Columns are called groups or families
 - Have similar properties and number of valence electrons
 - Some have special names

• Alkali Metals	Group 1
• Alkaline Earth Metals	Group A
• Chalcogens	Group 16
• Halogens	Group 17
• Noble Gases	Group 18

2

Periodic Classifications

- **Remember:**
 - Horizontal rows are called periods
 - They vary in properties
 - From left to right
 - Metallic properties
 - Atomic radius
 - Electronegativity

3

Free Elements

- There are special elements that exist in different forms when they are free elements
 - Diatomic molecules
 - Br₂, I₂, N₂, Cl₂, H₂, O₂, F₂
 - Other molecular compounds
 - S₈ and P₄

4

Ion Formation

- Metals typically form cations where as nonmetals typically form anions
- Ion Formation is based on stability

• Group 1	1+ cation
• Group 2	2+ cation
• Group 3-12	Varies
• Group 13	3+ cation
• Group 15	3- anion
• Group 16	2- anion
• Group 17	1- anion

5

Periodic Trends in Physical Properties

- There are five properties which we are going to focus on
 1. Effective nuclear charge
 2. Atomic radius
 3. Ionic radius
 4. Ionization Energy
 5. Electron Affinity

6

Effective Nuclear Charge

- **Effective Nuclear Charge (Z_{eff}):**
 - The charge/attraction felt by an electron from the nucleus
 - Relates to atomic number (# of protons) and shielding/screening electrons

7

Effective Nuclear Charge

- **Shielding Electrons:**
 - Electrons in the energy levels between the nucleus and the valence shell electrons
 - They "shield" the valence electrons from the attractive force exerted by the protons in the nucleus
 - Z_{eff} decreases with increasing # of shielding electrons

8

Effective Nuclear Charge

- $Z_{eff} = Z - S$
 - Z = nuclear charge (atomic number)
 - S = the screening constant (approximately equal to the # of core electrons)

9

Effective nuclear charge experienced by a valence electron
The shielding electrons (10-) and the nucleus (11+) combine to have a 1+ effect.

10

Z_{eff} Trend

Effective Nuclear Charge →

1A 1 H	2A 2 He																	3A 13 B	4A 14 C	5A 15 N	6A 16 O	7A 17 F	8A 18 Ne

11

Atomic Radius

- **Atomic Radius:**
 - $\frac{1}{2}$ the distance between the nuclei of 2 adjacent atoms
- Atomic radius is directly related to Z_{eff}

12

Radius and Bond Length

- Measured in Angstrom (Å)
- Distance between two nuclei in a bond (bonding atomic radius)
- Distance between two nuclei in collision (nonbonding atomic radius)

13

Trend for Atomic Radius

- Down a column, atomic radius increases
 - Increase in energy shells
 - Outer electrons more likely to be farther from nucleus
- Across a period, atomic radius decreases
 - Increase in effective nuclear charge (Z_{eff})

14

Trend for Atomic Radius

15

Ionic Radius

- **Anions** are larger than their atoms (e^- added to outermost orbital; more e^-e^- repulsion)
- **Cations** are smaller than their atoms (e^- removed from outermost orbital; less e^-e^- repulsion)
- Ionic radius is directly related to Z_{eff} , too

16

Trend for Ionic Radius

- Follows same trend as atomic radius for same reasons
- Exception occurs when switching from cations to anions at Group 4A/14

17

Isoelectronic Series

- Groups of ions all containing the same number of electrons
- What is the relationship between atomic number and radius in an isoelectronic series?

	O ²⁻	F ⁻	Na ⁺	Mg ²⁺	Al ³⁺
Electrons	10	10	10	10	10
Protons	8	9	11	12	13
Radius	1.26 Å	1.19 Å	1.16 Å	0.86 Å	0.68 Å

18

Ionization Energy

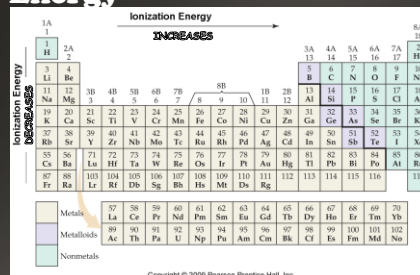

- The minimum energy (in kJ/mol) required to remove a ground state electron from a gaseous atom

- Always a positive value where the magnitude is a measure of how "tightly" the electron is held in the atom

19

Trend for Ionization Energy

20

Ionization Energy

- What do you notice about the successive removal of electrons?

TABLE 7.2 • Successive Values of Ionization Energies, I_n , for the Elements Sodium through Argon (kJ/mol)

Element	I_1	I_2	I_3	I_4	I_5	I_6	I_7
Na	495	4502	(inner-shell electrons)				
Mg	738	1451	2733				
Al	578	1817	2745	11,577			
Si	786	1577	3232	4356	16,091		
P	1012	1907	2914	4964	6274	21,267	
S	1000	2252	3357	4556	7004	8496	27,107
Cl	1251	2298	3822	5159	6542	9362	11,018
Ar	1521	2666	3931	5771	7238	8781	11,995

21

Electron Affinity (E_{ea})

- A measure of energy gained or released when an atom accepts an electron to form an anion

- Elements with high electron affinity **release** a lot of energy when accepting an electron (and become more stable)

- A positive electron affinity means that the resulting anion is unstable so atom must **gain** energy to form it

22

Trend of Electron Affinity

H -73						He > 0	
Li -60	Be > 0	B -27	C -122	N > 0	O -141	F -328	Ne > 0
Na -53	Mg > 0	Al -43	Si -134	P -72	S -200	Cl -349	Ar > 0
K -48	Ca -2	Ga -30	Ge -119	As -78	Se -195	Br -325	Kr > 0
Rb -47	Sr -5	In -30	Sn -107	Sb -103	Te -190	I -295	Xe > 0
1A	2A	3A	4A	5A	6A	7A	8A

23

Electronegativity

- The ability of an atom to attract electrons towards itself in a chemical bond

24

Reactivity

- **Group Trends:**
 - **Metals:**
 - Increases top to bottom
 - Most reactive
 - **Non-Metals:**
 - Decreases down group
 - Most reactive
- **Period Trends:**
 - **Metals:**
 - Decreases left to right
 - **Non-Metals:**
 - Increases left to right

25
